About the Tutorial

SAP Web Dynpro is a standard SAP UI technology to develop web applications using graphical tools and development environment integrated with ABAP workbench. The use of graphical tools reduces the implementation effort and helps maintain components in ABAP workbench.

This tutorial explains the key concepts of Web Dynpro with relevant screenshots for better understanding.

Audience

This tutorial is designed for all those who want to learn the basics of SAP Web Dynpro and advance in the field of software development.

Prerequisites

Basic knowledge of ABAP is a must to understand this tutorial. Understanding the Model-View-Controller (MVC) model and having experience in web applications is a plus.

1. Web Dynpro – Overview

Web Dynpro is a standard SAP UI technology that allows you to develop web applications using graphical tools and development environment integrated with ABAP workbench. Using graphical tools reduces the implementation effort and you can better reuse and maintain components in ABAP workbench.

To access Web Dynpro runtime environment and graphical tools in ABAP workbench, you can **use Transaction code: SE80**

Key Benefits of Using Web Dynpro

Following are the key benefits of using Web Dynpro for developers in ABAP environment:

- You can easily maintain and reuse the components for development.
- Less implementation time with the use of graphical tools.
- You can easily change the layout and navigation using graphical tools.
- Easy structure changes.
- With the use of data binding, you can use automatic data transport.
- Ease of integration in ABAP environment.

Web Dynpro ABAP is the same as Web Dynpro Java and supports the same set of functions for the application development.

2. Web Dynpro – Configuration & Integration

Once you install ABAP application server, it is necessary to configure it properly for application development.

To find the details about ABAP configuration, you can go to SAP Reference IMG -> SAP NetWeaver -> Application Server

The screenshot shows the SAP Display IMG interface. The top navigation bar includes icons for Existing BC Sets, BC Sets for Activity, Activated BC Sets for Activity, and a Release button. The main area is titled 'Structure' and lists various SAP modules. A red arrow points to the 'SAP NetWeaver' node, and another red arrow points to the 'Application Server' node under it.

Category	Sub-Category
SAP NetWeaver	Gateway
	Gateway Service Enablement
UI Technologies	General settings
	Mobile Infrastructure
Business Warehouse	Business Warehouse
	Application Server

If you are using SAP Solman, you can check this configuration by going to T-Code: SOLAR_LIBRARY.

To use Web Dynpro with ABAP application development, you have to make additional configuration for web Dynpro programming.

Internet Communication Manager

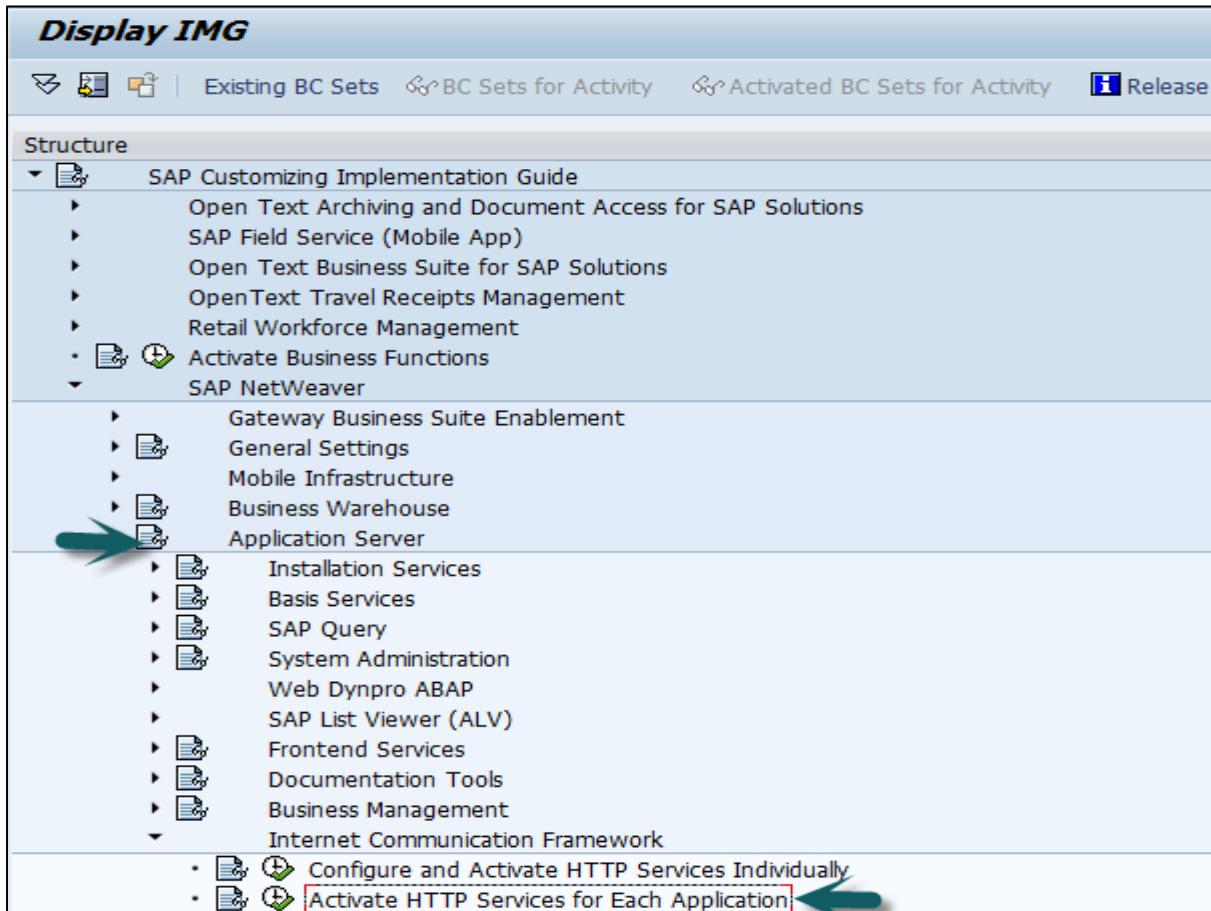

You need to set HTTP/HTTPS in ICM service. A service contains following different components:

- Service/Port
- Protocol used in service HTTP/HTTPS
- Processing timeout
- Keep alive timeout
- Service status: Active/inactive

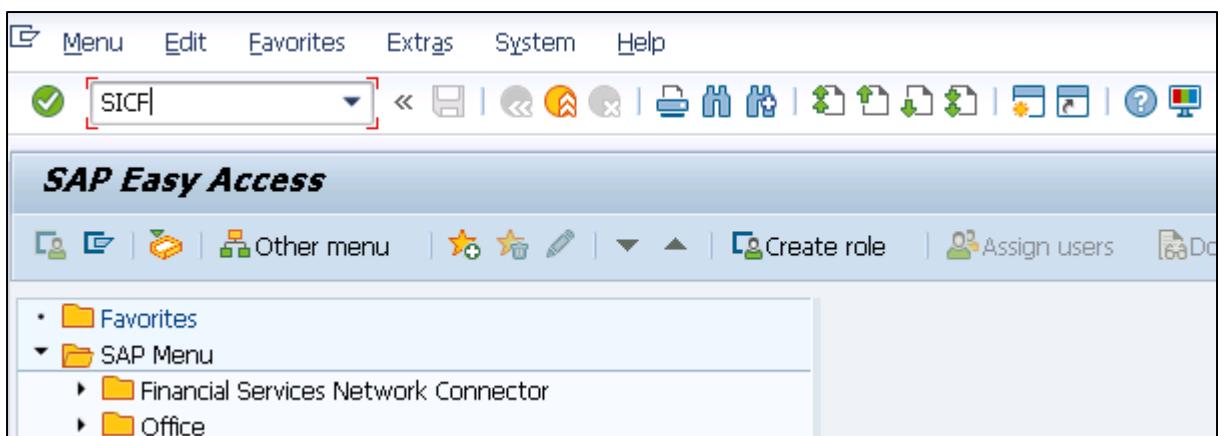

You can choose Go To -> Service to create, delete, activate or deactivate services. To display the ICM server cache statistics, choose Goto ->Statistics

Internet Communication Framework

You should activate the Internet Communication Framework (ICF) service. You can activate this service by going to SPRO -> SAP Reference IMG -> SAP NetWeaver -> Application Server -> Internet Communication Framework -> Activate HTTP service

When you install Application server ABAP, all ICF services are in inactive state. You can maintain ICF services using T-code: SICF under ICF tree.

You can activate ICF service in the following ways:

- Using the menu option, Service/Host -> Activate
- Using the context menu and choosing Activate Service.

The screenshot shows the SAP Web Dynpro 'Maintain Services' interface. At the top, there's a toolbar with icons for search, info, and other functions. Below it is a section titled 'Filter for Calling ICF Hierarchy' with fields for Hierarchy Type (set to 'SERVICE'), Virtual Host, Service Path, Service Name, Reference Service, Description, and Language (set to English). Another section below it is 'Filter for Detail Information' with fields for Created By, Created On, Last Changed By, and Changed On.

A context menu is open at the top left, with 'Service/Host' selected. Other options in the menu include 'Create Host', 'Create Service' (F7), 'Display/Change' (F8), 'Activate' (Shift+F11, highlighted with a yellow background), 'Deactivate' (Shift+F12), 'Alias References', 'Delete' (Shift+F2), 'Wizard: Create Service' (F9), and 'Exit' (Shift+F3). The menu also includes a language selection dropdown set to 'English' and buttons for 'Apply', 'Reset', and 'Fine-Tune'.

Layout Editor in View Designer

You should activate all the services in SICF for Web Dynpro ABAP to use the layout editor in the view designer.

Single Sign On

You should set SSO on the relevant host.

FQDN

You should use fully qualified domain names FQDN and short forms should be avoided.

3. Web Dynpro – Architecture

Web Dynpro is an ABAP environment for web development and is based on the Model View Controller (MVC) concept of UI programming. It is available for both Java and ABAP as per the platform, and supports similar functions.

Web Dynpro has the following features:

- Separation of display and business logic
- Easy change in the layout with the use of graphical tools
- No platform dependency of interfaces

Following are the key concepts as part of Web Dynpro architecture:

Metadata

Web Dynpro provides you with an environment for the development of web-based applications and you can use graphical tools to define web Dynpro application in the form of metadata in application development. You can also define your own events; however, event handling should be defined in a separate code and that has to be executed when an event is triggered.

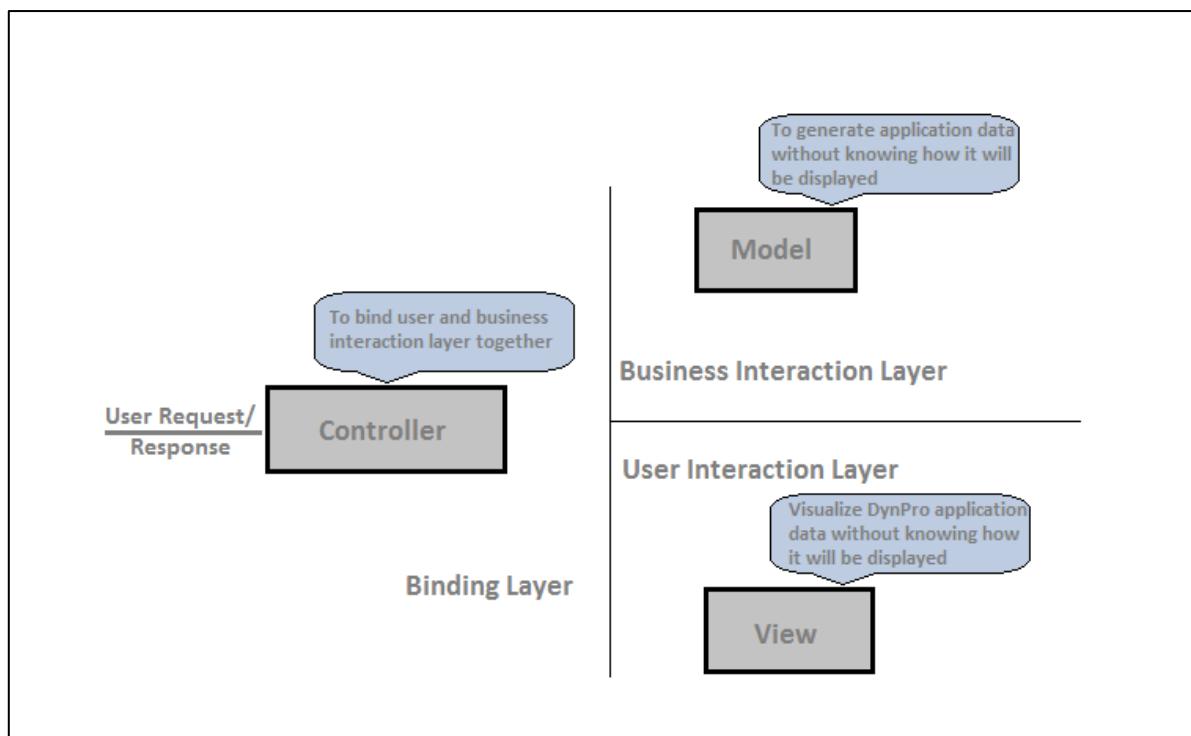

The user interface in Web Dynpro application consists of small elements defined by using Web Dynpro tools. You can also change or enhance the user interface by changing these elements at run time or integrate the elements again.

Graphical Tools

There are a wide range of graphical Web Dynpro tools that you can use to generate web-based applications. You don't need to create source code for this. Following are the key features of graphical tools in Web Dynpro application:

- Define properties of user interface elements
- Data flow
- User interface layout

For all these properties, you can use graphical tools without creating a source code.

Business and Application Logic

Web Dynpro allows you to run your application on the front-end and the back-end system can be accessed using service locally or via a remote connection. Your user interface is maintained in Dynpro application and persistent logic runs in the back-end system.

You can connect Web Dynpro application to the back-end system using an adaptive RFC service or by calling a web service.

MVC Programming Model

Web Dynpro applications are based on MVC model:

Model: This allows the access to back end data in a Web Dynpro application.

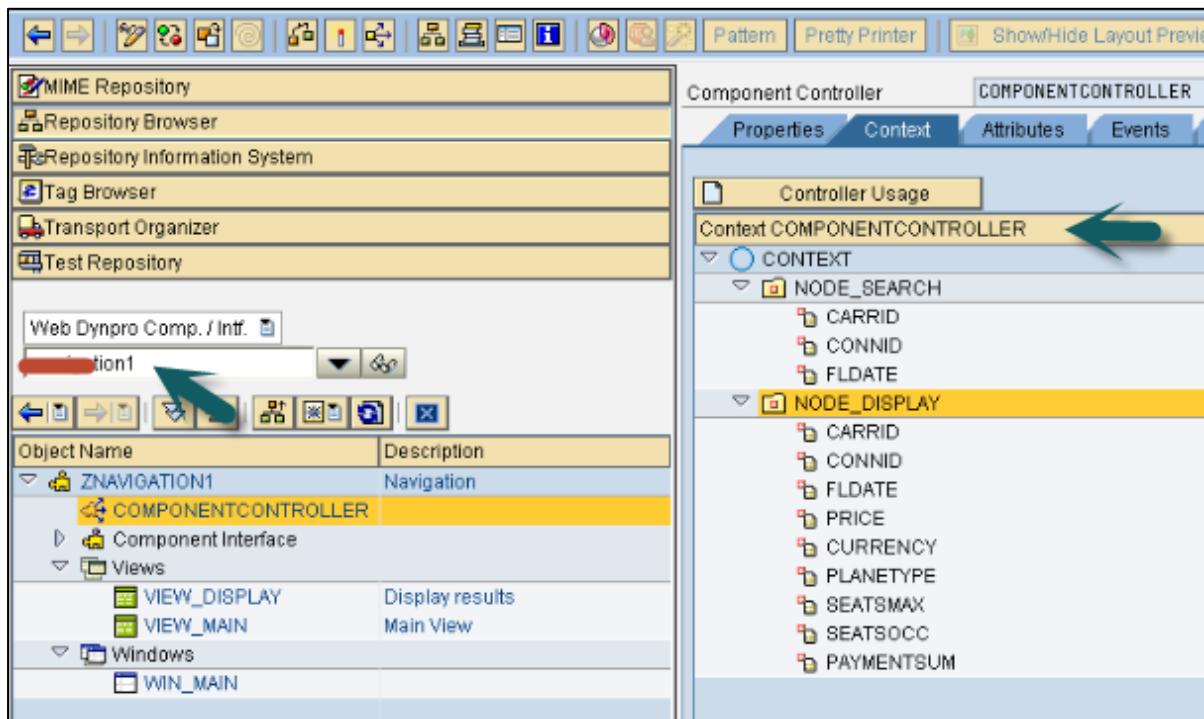

View: This is used to ensure the representation of data in a web browser.

Controller: This is used to control communication between Model and View where it takes input from the users and gets the processes data from the model and displays the data in the browser.

4. Web Dynpro – Navigation

In Web Dynpro application, you can navigate from one view to the other view using plugs.

Run T-code: SE 80 and create a simple Web Dynpro component:

We have created a Web Dynpro component with two nodes and two views.

VIEW_DISPLAY displays the output in a tabular format and **VIEW_MAIN** performs search parameters. In **VIEW_MAIN** you have configured the search layout and **VIEW_DISPLAY** contains the display layout.

VIEW_MAIN Active

Favorites

- text
- action
- selection
- complex
- layout
- graphic
- integration

Airline Code: *

Flight Conn. No:

Flight Date:

VIEW_DISPLAY Active(revised)

Airline	Flight Number	Date	Airfare
VIEW_DISPLAY.NODE_DISPLAY.CARRID	VIEW_DISPLAY.NODE_DISPLAY.CONNID	VIEW_DISPLAY.NODE_DISPLAY.FLDATE	VIEW_DISPLAY.NODE_DISPLAY.FLDATE
VIEW_DISPLAY.NODE_DISPLAY.CARRID	VIEW_DISPLAY.NODE_DISPLAY.CONNID	VIEW_DISPLAY.NODE_DISPLAY.FLDATE	VIEW_DISPLAY.NODE_DISPLAY.FLDATE

In VIEW_MAIN you have configured inbound plugs IN_MAIN and OUT_FROM_MAIN as outbound plugs. Similarly, create an inbound and outbound plugs for VIEW_DISPLAY.

VIEW_MAIN Active

Inbound Plugs

Plug Name	Description	Event Handler
IN_MAIN	Back to Main View	HANDLEIN_MAIN

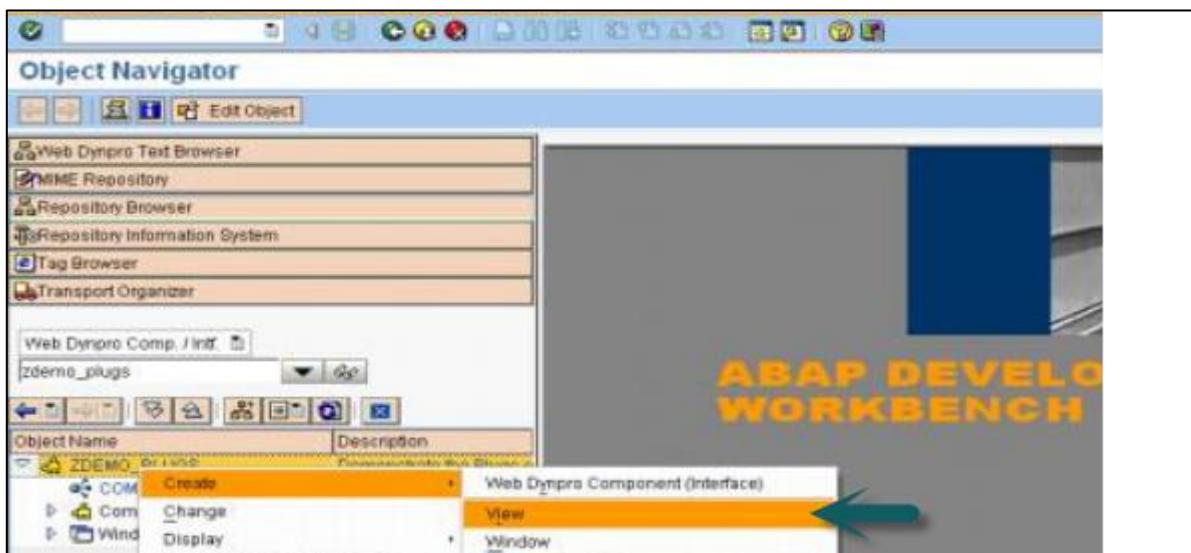

VIEW_MAIN Active

Outbound Plugs

Plug Name	Description
OUT_FROM_MAIN	Out from Main View

How to Create a New View?

Step 1: Click the component in object tree and go to the context menu as shown in the following screenshot:

Step 2: Enter view name and click on tick mark.

This screenshot shows the 'Create View' dialog box. It has three input fields: 'Component' with 'ZDEMO_PLUGS', 'View' with 'Search' (which has a teal arrow pointing to it), and 'Description' with 'Search for Flights'. At the bottom, there are two buttons: a red-bordered 'Checkmark' button and a 'Cancel' button.
