## About the Tutorial

---

Tcl is a general purpose multi-paradigm system programming language. It is a scripting language that aims at providing the ability for applications to communicate with each other.

On the other hand, Tk is a cross platform widget toolkit used for building GUI in many languages.

This tutorial covers various topics ranging from the basics of the Tcl/ Tk to its scope in various applications.

## Audience

---

This tutorial is designed for all those individuals who are looking for a starting point of learning Tcl/ Tk. Therefore, we cover all those topics that are required for a beginner and an advanced user.

## Prerequisites

---

Before proceeding with this tutorial, it is advisable for you to understand the basic concepts of computer programming. This tutorial is self-contained and you will be able to learn various concepts of Tcl/Tk even if you are a beginner. You just need to have a basic understanding of working with a simple text editor and command line.

# 1. Tcl – Overview

Tcl is shortened form of **Tool Command Language**. John Ousterhout of the University of California, Berkeley, designed it. It is a combination of a scripting language and its own interpreter that gets embedded to the application, we develop with it.

Tcl was developed initially for Unix. It was then ported to Windows, DOS, OS/2, and Mac OSX. Tcl is much similar to other unix shell languages like Bourne Shell (Sh), the C Shell (csh), the Korn Shell (sh), and Perl.

It aims at providing ability for programs to interact with other programs and also for acting as an embeddable interpreter. Even though, the original aim was to enable programs to interact, you can find full-fledged applications written in Tcl/Tk.

## Features of Tcl

---

The features of Tcl are as follows:

- Reduced development time.
- Powerful and simple user interface kit with integration of TK.
- Write once, run anywhere. It runs on Windows, Mac OS X, and almost on every Unix platform.
- Quite easy to get started for experienced programmers; since, the language is so simple that they can learn Tcl in a few hours or days.
- You can easily extend existing applications with Tcl. Also, it is possible to include Tcl in C, C++, or Java to Tcl or vice versa.
- Have a powerful set of networking functions.
- Finally, it's an open source, free, and can be used for commercial applications without any limit.

## Applications

---

Tcl is a general-purpose language and you can find Tcl everywhere. It includes,

- Scalable websites that are often backed by databases.
- High performance web servers build with TclHttpd.
- Tcl with CGI based websites.
- Desktop GUI applications.
- Embedded applications.

## 2. Tcl – Environment Setup

### Try it Option

You really do not need to set up your own environment to start learning Tcl programming. Reason is very simple, we already have set up Tcl Programming environment online, so that you can execute all the Tcl examples online at the same time when you are doing your theory work. This gives you confidence in what you are reading and to check the result with different options. Feel free to modify any example and execute it online.

Try following example using '**Try it**' option available at the top right corner of the sample code box:

```
#!/usr/bin/tclsh

puts "Hello, World!"
```

For most of the Tcl examples given in this tutorial, you will find **Try it** option, so just make use of it and enjoy your learning. For Tk examples, you will need to have a console to see graphical results; so, we recommend to have your own Tk setup.

### Local Environment Setup

---

If you are willing to set up your environment for Tcl, you need the following two software applications available on your computer:

- (a) Text Editor
- (b) Tcl Interpreter.

### Text Editor

---

This will be used to type your program. Examples of a few text editors include Windows Notepad, OS Edit command, Brief, Epsilon, EMACS, and vim or vi.

Name and version of a text editor can vary on different operating systems. For example, Notepad will be used on Windows, and vim or vi can be used on windows as well as Linux or UNIX.

The files you create with your text editor are called source files and contain program source code. The source files for Tcl programs are named with the extension **".tcl"**.

Before starting your programming, make sure you have one text editor in place and you have enough experience to write a computer program, save it in a file, build it, and finally execute it.

## The Tcl Interpreter

---

It is just a small program that enables you to type Tcl commands and have them executed line by line. It stops execution of a tcl file, in case, it encounters an error unlike a compiler that executes fully.

Let's have a helloWorld.tcl file as follows. We will use this as a first program, we run on a platform you choose.

```
#!/usr/bin/tclsh

puts "Hello World!"
```

## Installation on Windows

---

Download the latest version for windows **installer** from the list of Active Tcl binaries available. The active Tcl community edition is free for personal use.

Run the downloaded executable to install the Tcl, which can be done by following the on screen instructions.

Now, we can build and run a Tcl file say helloWorld.tcl by switching to folder containing the file using 'cd' command and then execute the program using the following steps

```
C:\Tcl> tclsh helloWorld.tcl
```

We can see the following output.

```
C:\Tcl> helloWorld
```

C:\Tcl is the folder, I am using to save my samples. You can change it to the folder in which you have saved Tcl programs.

## Installation on Linux

---

Most of the Linux operating systems come with Tcl inbuilt and you can get started right away in those systems. In case, it's not available, you can use the following command to download and install Tcl-Tk.

```
$ yum install tcl tk
```

Now, we can build and run a Tcl file say helloWorld.tcl by switching to folder containing the file using 'cd' command and then execute the program using the following steps:

```
$ tclsh helloWorld.tcl
```

We can see the following output:

```
$ hello world
```

## Installation on Debian based Systems

---

In case, it's not available in your OS, you can use the following command to download and install Tcl-Tk:

```
$ sudo apt-get install tcl tk
```

Now, we can build and run a Tcl file say helloWorld.tcl by switching to folder containing the file using 'cd' command and then execute the program using the following steps:

```
$ tclsh helloWorld.tcl
```

We can see the following output:

```
$ hello world
```

## Installation on Mac OS X

---

Download the latest version for Mac OS X **package** from the list of Active Tcl binaries available. The active Tcl community edition is free for personal use.

Run the downloaded executable to install the Active Tcl, which can be done by following the on screen instructions.

Now, we can build and run a Tcl file say helloWorld.tcl by switching to folder containing the file using 'cd' and then execute the program using the following steps:

```
$ tclsh helloWorld.tcl
```

We can see the following output:

```
$ hello world
```

## Installation from Source Files

---

You can use the option of installing from source files when a binary package is not available. It is generally preferred to use Tcl binaries for Windows and Mac OS X, so only compilation of sources on unix based system is shown below.

- Download the **source files**.
- Now, use the following commands to extract, compile, and build after switching to the downloaded folder.

```
$ tar xzf tcl8.6.1-src.tar.gz
$ cd tcl8.6.1
$ cd unix
$ ./configure --prefix=/opt --enable-gcc
$ make
```

```
$ sudo make install
```

**Note:** Make sure, you change the file name to the version you downloaded on commands 1 and 2 given above.

# 3. Tcl – Special Variables

In Tcl, we classify some of the variables as special variables and they have a predefined usage/functionality. The list of special variables is listed below.

| Special Variable | Description  |
|------------------|--|
| argc             | Refers to a number of command-line arguments.  |
| argv             | Refers to the list containing the command-line arguments.  |
| argv0            | Refers to the file name of the file being interpreted or the name by which we invoke the script.                                       |
| env              | Used for representing the array of elements that are environmental variables.  |
| errorCode        | Provides the error code for last Tcl error.  |
| errorInfo        | Provides the stack trace for last Tcl error.   |
| tcl_interactive  | Used to switch between interactive and non-interactive modes by setting this to 1 and 0 respectively.                                  |
| tcl_library      | Used for setting the location of standard Tcl libraries.   |
| tcl_pkgPath      | Provides the list of directories where packages are generally installed.   |
| tcl_patchLevel   | Refers to the current patch level of the Tcl interpreter.  |
| tcl_platform     | Used for representing the array of elements with objects including byteOrder, machine, osVersion, platform, and os.                    |
| tcl_precision    | Refers to the precision i.e. number of digits to retain when converting to floating-point numbers to strings. The default value is 12. |
| tcl_prompt1      | Refers to the primary prompt.  |
| tcl_prompt2      | Refers to the secondary prompt with invalid commands.  |
| tcl_rcFileName   | Provides the user specific startup file.   |
| tcl_traceCompile | Used for controlling the tracing of bytecode compilation. Use 0 for no output, 1 for summary, and 2 for detailed.                      |
| tcl_traceExec    | Used for controlling the tracing of bytecode execution. Use 0 for no output, 1 for summary, and 2 for detailed.                        |
| tcl_version      | Returns the current version of the Tcl interpreter.  |

The above special variables have their special meanings for the Tcl interpreter.

## Examples for using Tcl Special Variables

---

Let's see some examples for special variables.

### Tcl Version

```
#!/usr/bin/tclsh

puts $tcl_version
```

When you run the program, you will get a similar output as shown below:

```
8.5
```

### Tcl Environment Path

```
#!/usr/bin/tclsh

puts $env(PATH)
```

When you run the program, you will get a similar output as shown below:

```
/web/com/GNUstep/Tools:/usr/GNUstep/Local/Tools:/usr/GNUstep/System/Tools:/usr/
local/sml/bin:/usr/local/flex/bin:/usr/local/gcc-
4.8.1/bin:/usr/share/java:./usr/share/java:/usr/lib/jvm/java/lib:/usr/lib/jvm/
java/jre/lib:/usr/local/bin:/usr/local/mozart/bin:/usr/local/go/bin:/usr/local/
factor:/usr/local/groovy-2.1.7/bin:/opt/Pawn/bin:/usr/local/icon-
v950/bin:/usr/local/lib/mono/4.0:/usr/lib64/qtC.3/bin:/usr/local/bin:/bin:/usr/
bin:/usr/local/sbin:/usr/sbin:/sbin:/opt/Pawn/bin:/usr/local/dart/bin:/usr/loca
l/julia/usr/bin:/usr/local/julia:/usr/local/scriptbasic/bin
```

### Tcl Package Path

```
#!/usr/bin/tclsh

puts $tcl_pkgPath
```

When you run the program, you will get a similar output as shown below:

```
/usr/lib64/tcl8.5 /usr/share/tcl8.5 /usr/lib64/tk8.5 /usr/share/tk8.5
```

## Tcl Library

```
#!/usr/bin/tclsh  
  
puts $tcl_library
```

When you run the program, you will get a similar output as shown below:

```
/usr/share/tcl8.5
```

## Tcl Patch Level

```
#!/usr/bin/tclsh  
  
puts $tcl_patchLevel
```

When you run the program, you will get a similar output as shown below:

```
8.5.7
```

## Tcl Precision

```
#!/usr/bin/tclsh  
  
puts $tcl_precision
```

When you run the program, you will get a similar output as shown below:

```
0
```

## Tcl Startup File

```
#!/usr/bin/tclsh  
  
puts $tcl_rcFileName
```

When you run the program, you will get a similar output as shown below:

```
~/.tclshrc
```
